Health C are Expenses in the United States, 1996

## Health Care Information and Electronic Ordering Through the AHRQ Web Site

The Agency for Healthcare Research and Q uality's W eb site- http://www.ahrq.gov/- makes practical, science-based health care information available in one convenient place.
Buttons correspond to major categories ofW eb site information, including funding opportunities, research findings, quality assessments, clinical information, consumer health, and data and surveys.
The W eb site features an Electronic C atalog to the more than 450 information products generated by AHRQ, with information on how to obtain these resources. Many information products have an electronic ordering form and are mailed free of charge from the AHRQ Clearinghouse within 5 working days.

## http://www.ahrq.gov/

#### Abstract

This report from the Agency for Healthcare Research and Quality presents descriptive data on health care spending in the United States. Data come from the 1996 Medical Expenditure Panel Survey (MEPS) and cover the civilian noninstitutionalized U.S. population. Information is given on total health care expenses combined and also for hospital inpatient services, ambulatory services, prescription medicines, dental services, home health services, and other medical equipment and supplies. The proportion of people with expenses; mean and median expenses; and the proportion of expenses paid by various sources, including out-of-pocket, Medicare, Medicaid, and private insurance, are shown for each type of service. In addition, distributions of expenses and sources of payment across the population are examined by selected demographic, socioeconomic, and health insurance characteristics.

The estimates in this report are based on the most recent data available from MEPS at the time the report was written. However, selected elements of MEPS data may be revised on the basis of additional analyses, which could result in slightly different estimates from those shown here. Please check the MEPSW eb site for the most current file releases.

# The Medical Expenditure Panel Survey (MEPS) 

## Background

The Medical Expenditure Panel Survey (MEPS) is conducted to provide nationally representative estimates of health care use, expenditures, sources of payment, and insurance coverage for the U.S. civilian noninstitutionalized population. MEPS also includes a nationally representative survey of nursing homes and their residents. MEPS is cosponsored by the Agency for Healthcare Research and Quality (AHRQ) and the National Center for Health Statistics (NCHS).

MEPS comprises four component surveys: the Household Component (HC), the Medical Provider Component (MPC), the Insurance Component (IC), and the Nursing Home Component (NHC). The HC is the core survey, and it forms the basis for the MPC sample and part of the IC sample. The separate NHC sample supplements the other MEPS components. Together these surveys yield comprehensive data that provide national estimates of the level and distribution of health care use and expenditures, support health services research, and can be used to assess health care policy implications.

MEPS is the third in a series of national probability surveys conducted by AHRQ on the financing and use of medical care in the United States. The National Medical Care Expenditure Survey (NMCES) was conducted in 1977, the National Medical Expenditure Survey (NMES) in 1987. Beginning in 1996, MEPS continues this series with design enhancements and efficiencies that provide a more current data resource to capture the changing dynamics of the health care delivery and insurance system.

The design efficiencies incorporated into MEPS are in accordance with the Department of Health and Human Services (DHHS) Survey Integration Plan of June 1995, which focused on consolidating DHHS surveys, achieving cost efficiencies, reducing respondent burden, and enhancing analytical capacities. To accommodate these goals, new MEPS design features
include linkage with the National Health Interview Survey (NHIS), from which the sample for the MEPS HC is drawn, and enhanced longitudinal data collection for core survey components. The MEPS HC augments NHIS by selecting a sample of NHIS respondents, collecting additional data on their health care expenditures, and linking these data with additional information collected from the respondents' medical providers, employers, and insurance providers.

## Household Component

The MEPS HC, a nationally representative survey of the U.S. civilian noninstitutionalized population, collects medical expenditure data at both the person and household levels. The HC collects detailed data on demographic characteristics, health conditions, health status, use of medical care services, charges and payments, access to care, satisfaction with care, health insurance coverage, income, and employment.

The HC uses an overlapping panel design in which data are collected through a preliminary contact followed by a series of five rounds of interviews over a $21 / 2$-year period. Using computer-assisted personal interviewing (CAPI) technology, data on medical expenditures and use for 2 calendar years are collected from each household. This series of data collection rounds is launched each subsequent year on a new sample of households to provide overlapping panels of survey data and, when combined with other ongoing panels, will provide continuous and current estimates of health care expenditures.

The sampling frame for the MEPS HC is drawn from respondents to NHIS, conducted by NCHS. NHIS provides a nationally representative sample of the U.S. civilian noninstitutionalized population, with oversampling of Hispanics and blacks.

## Medical Provider Component

The MEPS MPC supplements and validates information on medical care events reported in the MEPS HC by contacting medical providers and pharmacies identified by household respondents. The MPC sample includes all hospitals, hospital physicians, home health agencies, and pharmacies reported in the

HC. Also included in the MPC are all office-based physicians:

- Providing care for HC respondents receiving Medicaid.
- Associated with a 75 -percent sample of households receiving care through an HMO (health maintenance organization) or managed care plan.
- Associated with a 25 -percent sample of the remaining households.

Data are collected on medical and financial characteristics of medical and pharmacy events reported by HC respondents, including:

- Diagnoses coded according to ICD-9 (9th Revision, International Classification of Diseases) and DSMIV (Fourth Edition, Diagnostic and Statistical Manual of Mental Disorders).
- Physician procedure codes classified by CPT-4 (Current Procedural Terminology, Version 4).
- Inpatient stay codes classified by DRG (diagnosisrelated group).
- Prescriptions coded by national drug code (NDC), medication names, strength, and quantity dispensed.
- Charges, payments, and the reasons for any difference between charges and payments.

The MPC is conducted through telephone interviews and mailed survey materials.

## Insurance Component

The MEPS IC collects data on health insurance plans obtained through private and public-sector employers. Data obtained in the IC include the number and types of private insurance plans offered, benefits associated with these plans, premiums, contributions by employers and employees, and employer characteristics.

Establishments participating in the MEPS IC are selected through three sampling frames:

- A list of employers or other insurance providers identified by MEPS HC respondents who report having private health insurance at the Round 1 interview.
- A Bureau of the Census list frame of private-sector business establishments.
- The Census of Governments from the Bureau of the Census.

To provide an integrated picture of health insurance, data collected from the first sampling frame (employers and other insurance providers) are linked back to data provided by the MEPS HC respondents. Data from the other three sampling frames are collected to provide annual national and State estimates of the supply of private health insurance available to American workers and to evaluate policy issues pertaining to health insurance. Beginning in 2000, national estimates of employer contributions to group health insurance from the MEPS IC are being used in the computation of Gross Domestic Product (GDP) by the Bureau of Economic Analysis.

The MEPS IC is an annual panel survey. Data are collected from the selected organizations through a prescreening telephone interview, a mailed questionnaire, and a telephone followup for nonrespondents.

## Nursing Home Component

The 1996 MEPS NHC was a survey of nursing homes and persons residing in or admitted to nursing homes at any time during calendar year 1996. The NHC gathered information on the demographic characteristics, residence history, health and functional status, use of services, use of prescription medications, and health care expenditures of nursing home residents. Nursing home administrators and designated staff also provided information on facility size, ownership, certification status, services provided, revenues and expenses, and other facility characteristics. Data on the income, assets, family relationships, and caregiving services for sampled nursing home residents were obtained from next-of-kin or other knowledgeable persons in the community.

The 1996 MEPS NHC sample was selected using a two-stage stratified probability design. In the first stage, facilities were selected; in the second stage, facility residents were sampled, selecting both persons in residence on January 1, 1996, and those admitted during the period January 1 through December 31.

The sampling frame for facilities was derived from the National Health Provider Inventory, which is updated periodically by NCHS. The MEPS NHC data were collected in person in three rounds of data collection over a $11 / 2$-year period using the CAPI system. Community data were collected by telephone using

## 解EPS

computer-assisted telephone interviewing (CATI) technology. At the end of three rounds of data collection, the sample consisted of 815 responding facilities, 3,209 residents in the facility on January 1, and 2,690 eligible residents admitted during 1996.

## Survey Management

MEPS data are collected under the authority of the Public Health Service Act. They are edited and published in accordance with the confidentiality provisions of this act and the Privacy Act. NCHS provides consultation and technical assistance.

As soon as data collection and editing are completed, the MEPS survey data are released to the public in staged releases of summary reports and microdata files. Summary reports are released as printed documents and electronic files. Microdata files are released on CD-ROM and/or as electronic files.

Printed documents and CD-ROMs are available through the AHRQ Publications Clearinghouse. Write or call:

# Health Care Expenses in the United States, 1996 

by Joel W. Cohen, Ph.D., Steven R. Machlin, M.S., Samuel H. Zuvekas, Ph.D., M arie N. Stagnitti, M.P.A., and Joshua M. Thorpe, M.P.H .,A gency for Healthcare Research and Q uality

## Introduction

The Medical Expenditure Panel Survey (MEPS) is the Nation's primary source of detailed, nationally representative data on medical care spending and sources of payment for the civilian noninstitutionalized population of the United States. One of the main objectives of the survey is to provide researchers and policymakers with data on the types of health care services Americans use, how frequently they use them, how much is paid for those services, and who pays what portion of the payments. Detailed information of this sort has not been available since the data from the 1987

National Medical Expenditure Survey (NMES) were released in the early 1990s (for example, Hahn and Lefkowitz, 1992). Since that time, the health care system in the United States has undergone tremendous change, making the need for updated expenditure data critical. The rapid evolution of managed care, improvements in medical technologies and medical practices, changes in reimbursement mechanisms, changes in the social insurance and safety net system, and increases in the number of uninsured have all contributed to changes in aggregate health care spending. In addition, these factors have contributed to changes in the distribution of expenses and sources of payments across the population.

This report presents descriptive data on spending in 1996 for hospital, office-based, home health, and other types of care by source of payment and characteristics of users. Data for all types of health care combined and for each type of service are presented: the proportion of people with expenses; mean and median expenses; and the proportion of expenses paid by various sources, including out-of-pocket, Medicare, Medicaid, and private insurance. In addition, distributions of expenses and sources of payment across the population are
examined by selected demographic, socioeconomic, and health insurance characteristics. Only differences between estimates that are statistically significant at the .05 level are discussed in the text. Detailed information on data sources and methods of estimation, along with definitions of the categories used in this report, are included in the Technical Appendix.

## Type of Service

In 1996, about $\$ 554$ billion in payments were made for the health care services and supplies received by the approximately 269 million people in the U.S. civilian noninstitutionalized population. Table 1 shows that inpatient hospital care, the largest component, accounted for nearly 4 of every 10 dollars spent ( 38 percent), followed by ambulatory services, which accounted for about 1 in 3 dollars spent ( 33 percent). Prescribed medicines accounted for about 13 percent of the total. The remaining expenses were for dental care ( 8 percent), home health services ( 6 percent), and other medical services ( 3 percent).

A total of $\$ 209.1$ billion was paid for 25.1 million inpatient hospital stays for all people in the civilian noninstitutionalized population in 1996, and $\$ 181.1$ billion in payments were made for about 1.4 billion ambulatory visits to offices, clinics, and outpatient departments. In addition, a total of $\$ 71.2$ billion was paid for 2.2 billion acquisitions of prescribed medicines (including refills and free samples) and $\$ 43.1$ billion in expenses were incurred for nearly 295 million visits to dental professionals.

## Total Expenses and Sources of Payment

In 1996, about 86 percent of the U.S. community population had medical expenses (Table 2). The average (mean) expense per person with expenses was $\$ 2,398$. However, half of all people with medical expenses had expenses of less than $\$ 559$ (the median
value). This large discrepancy between the mean and median values occurs because a small proportion of people incurred a disproportionately large share of medical expenses.

Third-party payers accounted for 82 percent of all health care expenses in 1996, while 18 percent were paid out of pocket. Private health insurance, which paid for about 45 percent of all expenses, was the largest third-party payer, followed by Medicare ( 21 percent) and Medicaid ( 9 percent).

## Demographic Characteristics

The percent of people using health care services was highest among the elderly, who also had the highest per capita expenditures; 96 percent of those age 65 and over had expenses, with an average expense per person of $\$ 5,644$. In contrast, only 85 percent of people under 65 years of age had medical expenses, and their average expense was about one-third as large $(\$ 1,865)$. The largest single payer of medical expenses for the elderly was Medicare, which paid for over half of their expenses ( 56 percent). For the non-elderly, private insurance was the largest payer, assuming half or more of total expenses in each age group under 65 .

Ninety percent of children under age 6 incurred an expense for health services, compared with 83 percent of those aged 6-17. Private insurance was the largest single payer for both groups. However, the proportion paid out of pocket was substantially lower for children under 6 than for children 6-17 years old ( 10 vs. 28 percent), a disparity largely attributable to differences in the use of dental services.

A significantly higher percent of females than males had medical expenses ( 90 vs. 82 percent), and median expenses for females were $\$ 224$ higher than those for males. However, there was not a significant difference between males and females in average expenses per person, and the distributions by source of payment were generally similar.

Only three-quarters of blacks and Hispanics incurred expenses for health care services in 1996, compared to 89 percent of whites. A substantially higher percent of expenses for blacks and Hispanics than for whites was paid by Medicaid; a higher percent of expenses for whites than for blacks and Hispanics was paid out of pocket or by private health insurance. Among those with health care expenses, the average
expense was significantly higher for whites than for Hispanics (\$2,521 vs. \$1,666).

Neither the percent of the population with an expense nor the average annual expense per person varied significantly between metropolitan statistical areas (MSAs) and rural areas. However, private health insurance paid for a higher percent of expenses incurred by people living in urban areas. In contrast, Medicare paid for a higher proportion of expenses incurred by people in rural areas.

A slightly smaller proportion of people in the South and West than in other regions incurred a medical expense in 1996, yet average expenses per person did not vary significantly by region. Also, there were no dramatic differences in the distribution of expenses by source of payment among the regions.

Among people under 65 years of age, those reported to have fair or poor health were more likely to have incurred medical expenses than people in better health ( 92 vs. 84 percent), and their average per capita expenses were also substantially higher ( $\$ 6,438$ vs. $\$ 1,385$ ). While the overwhelming majority of people age 65 and over had medical expenses in 1996, average expenses per person were substantially higher for elderly people in fair or poor health ( $\$ 9,729$, compared to $\$ 3,831$ for elderly people in better health). Among the elderly, the Medicare and Medicaid programs paid for larger proportions of expenses incurred by those in fair or poor health, and larger proportions were paid out of pocket or by private health insurance for those in better health.

## Insurance and Income

Among people under 65 , only 63 percent of the uninsured had medical expenses, compared to 88 percent of those with private insurance coverage and 85 percent of those with public coverage at any time in 1996. The average expense per person with an expense was highest for those with public insurance $(\$ 2,323)$ and lowest for the uninsured (\$942). About two-thirds of expenses for people under age 65 with public insurance were paid by the Medicaid program. Out-ofpocket payments constituted a substantially higher proportion of expenses for the uninsured ( 44 percent) than for people with private ( 20 percent) or public insurance ( 8 percent).

Among the population age 65 and over, people with Medicare and supplemental private insurance coverage
were slightly more likely to have expenses than Medicare beneficiaries with supplemental public insurance coverage or no supplemental coverage. Expenses were highest among people with combined Medicare and other public coverage; their average was $\$ 7,727$ per person with an expense, of which only 5 percent was paid out of pocket. Out-of-pocket spending was substantially higher for people with Medicare only (20 percent) and for those with Medicare plus additional private coverage ( 16 percent).

High-income individuals were more likely to have medical care expenses than those who were poor (91 vs. 80 percent). The proportions of expenses paid out of pocket and by private health insurance generally rose as income increased. Conversely, Medicaid paid for over one-quarter of total medical expenses for the poor (29 percent), but this percentage declined sharply with higher income.

## Inpatient Hospital Services

The inpatient expenditure estimates shown in Table 3 include room and board and all hospital diagnostic and laboratory expenses associated

## Expenses for

 inpatient hospital andhome health
services were
the highest, but
relatively few
people used these services. with the basic facility charge, payments for separately billed physician inpatient services, and emergency room expenses incurred immediately prior to inpatient stays. As shown in the table, approximately 7 percent of the population had expenses for at least one inpatient hospital stay in 1996, with an average expense of $\$ 11,492$ per person for those with inpatient expenses. The median expense per person with an expense was less than half that amount ( $\$ 5,330$ ), reflecting the skewed distribution of expenses for inpatient care. The bulk of expenses were paid by private insurance ( 47 percent) and Medicare (32 percent), with relatively little paid out of pocket (2 percent).

## Demographic Characteristics

The elderly were more likely than people in younger age groups to incur expenses for inpatient care, with almost 1 in 5 elderly people having inpatient expenses. In general, the elderly were more than three times as
likely to incur expenses as the non-elderly ( 18 vs. 5 percent). Average expenses per person, however, were not significantly higher for the elderly than for the nonelderly. About three-quarters of expenses for the elderly ( 77 percent) were paid by the Medicare program, but only 2 percent by Medicaid. In contrast, Medicare paid 6 percent of inpatient expenses for the population under 65, while Medicaid paid 15 percent. Moreover, although private insurance covered only 16 percent of inpatient expenses for the elderly, it paid nearly two-thirds of the expenses for the non-elderly.

Females were more likely than males to have inpatient expenses ( 8 vs. 6 percent), but average expense for those with an expense was higher for males ( $\$ 15,133$ vs. $\$ 9,090$ ). There were no significant differences in the distribution of payment sources by sex.

There were no differences in the probability of expense by race/ethnicity, and there was no significant difference in average expenses between whites and blacks. However, average expense for those with an expense was higher for whites than for Hispanics ( $\$ 11,710$ vs. $\$ 7,976$ ). There were some differences in the distribution of payments among whites, blacks, and Hispanics. For example, private insurance paid for half of inpatient hospital expenses for whites, but only about one-third for blacks. Similarly, Medicare paid for about one-third of inpatient expenses for whites, compared with only about one-fifth for blacks. In contrast, the Medicaid program covered a higher proportion of expenses for blacks and Hispanics than for whites. Medicaid paid for about one-quarter of inpatient hospital expenses for blacks and just under one-fifth for Hispanics, compared with less than one-tenth (7 percent) for whites.

The percent of people with hospital expenses did not vary by MSA, but there were some differences by Census Region. Those living in the West were less likely to incur inpatient expenses than people living in any of the other three regions ( 6 percent compared with approximately 7 percent in each of the other regions). The distribution of sources of payment did not vary significantly by Census Region. However, people living outside MSAs were less likely than those living in MSAs to have their expenses paid by private insurance ( 35 percent vs. 55 percent) and were more likely to have them paid by Medicare ( 44 percent vs. 25 percent).

For both the elderly and non-elderly, perceived health status was associated with both the probability of incurring inpatient expenses and the mean expense per
person with an expense. Among the group under age 65 , those in fair or poor health were more than four times as likely to have inpatient expenses as those in good to excellent health ( 18 percent vs. 4 percent). In addition, their average annual expenses were more than twice as high ( $\$ 17,000$ vs. $\$ 8,000$ ). The same pattern was true for the population 65 and over, although the differences were not quite as large. There were no significant differences in the distribution of sources of payment by health status.

## Insurance and Income

For the population under age 65 , the probability of incurring inpatient hospital expenses was lowest for the uninsured and highest for those with public insurance only. The average expense per person with an expense did not differ significantly between the publicly and privately insured, however. The sources of payment for the non-elderly population varied by insurance status, with the privately insured having the overwhelming majority ( 85 percent) of their expenses covered by private insurance and the publicly insured having the bulk of their expenses ( 70 percent) covered by Medicaid. For the elderly, no significant differences in the probability of incurring inpatient expenses were associated with insurance status.

People with high incomes were the least likely to have inpatient expenses ( 5 percent); those in the poor and near-poor groups were about twice as likely to incur expenses. Mean annual expenses per person with an expense did not vary significantly by income level, however. With respect to sources of payment, private insurance paid for more than half of the expenses for the middle- and high-income populations, compared with only one-third for the low-income population. The lower income groups had substantial portions of their expenses paid for by Medicaid (as much as one-quarter for those with incomes below poverty). Medicare was the other major payer of inpatient expenses for all income groups, with payments ranging from 22 percent of the total for those with high incomes to 41 percent of the total for the low-income group.

## Ambulatory Services

Nearly three-quarters of the civilian noninstitutionalized population had expenses for physician and nonphysician medical providers seen in
office-based settings or clinics, hospital outpatient departments, emergency rooms, and clinics owned and operated by hospitals (Table 4). For those with expenses, annual expenses for ambulatory services during 1996 averaged $\$ 920$, while the median expense was $\$ 274$. Private insurance was the single largest payer, accounting for 52 percent of ambulatory expenses, while Medicare and Medicaid accounted for 16 and 7 percent, respectively. About 16 percent of all ambulatory expenses were paid out of pocket.

## Demographic Characteristics

More than four-fifths ( 84 percent) of children under 6 had ambulatory expenses, compared to two-thirds ( 67 percent) of children ages 6-17. There were no differences between younger and older children in average expenses for those with expenses. Both younger and older children had substantially lower average expenses than adults age 45 and over (about $\$ 400$ vs. over $\$ 1,300$ ).

Among adults, those 65 and over were the most likely to have ambulatory expenses ( 89 percent) and had the highest average expenses $(\$ 1,436)$ for those with expenses. People 45-64 years of age were more than 10 percentage points less likely than the elderly to have expenses, but they had a similar average expense. Adults ages 18-44 were about as likely ( 66 percent) as children ages 6-17 to have expenses, but their average expenses of $\$ 829$ were almost twice the average for children under age 18. The average expenses of adults ages 18-44 were more than 40 percent less than those for adults 65 and over.

Among the non-elderly, private insurance paid for approximately three-fifths ( 61 percent) of ambulatory expenses, out-of-pocket spending accounted for about one-fifth (19 percent), and Medicaid accounted for 8 percent. Among the elderly, Medicare paid for almost three-fifths (58 percent) of expenses, private insurance paid for another quarter ( 25 percent), out-of-pocket spending accounted for only 9 percent, and Medicaid paid for only 2 percent.

Females were more likely than males to have ambulatory expenses ( 79 vs .68 percent) and had higher expenses on average ( $\$ 972$ vs. $\$ 855$ ). A slightly higher proportion of expenses for females than for males was paid by Medicaid, but there were no differences in the other sources of payment.

## 4

Whites were more likely than blacks or Hispanics to have ambulatory expenses ( 77 vs. 63 and 61 percent, respectively) and also had higher average ambulatory expenses ( $\$ 984$ vs. $\$ 639$ and $\$ 688$, respectively). The distribution of sources of payment also varied by race/ethnicity. Private insurance paid for a greater percent of expenses for whites, while blacks and Hispanics had significantly greater percents paid for by Medicaid. Whites and

Elderly people were much more likely than people under
age 65 to have a prescription medicine expense, and their average prescription expenses were more than twice as high.

Hispanics also spent a greater proportion out of pocket (16-17 percent) than blacks (12 percent).
Medicare paid for more than twice the share of expenses for blacks (21 percent) as for Hispanics (10 percent).

There were no differences by MSA status in either the percent with ambulatory expenses or average expenses. However, private insurance paid a slightly higher proportion of expenses in urban areas, while Medicare paid a higher proportion in rural areas. In terms of regional comparisons, the Northeast and Midwest had the largest percent of people with ambulatory expenses. The distribution of sources of payment was fairly similar across the four regions.

People in fair or poor health were substantially more likely to have ambulatory expenses, and they had higher average expenses than those in good to excellent health. Among the population under 65,86 percent of those in poor or fair health had ambulatory expenses (average expense, $\$ 1,894$ ), compared with 70 percent of those in good to excellent health (average expense, $\$ 712$ ). Differences between those in fair or poor health and those in better health were smaller among those 65 and over than for the non-elderly.

## Insurance and Income

Among people under 65 , there was no difference between the privately and publicy insured in the percent with ambulatory expenses ( 75 percent), but the uninsured were substantially less likely to have any expenses ( 47 percent). Among the non-elderly who had ambulatory expenses, those with private insurance had the highest level of expenditures, $\$ 877$, compared to
$\$ 751$ for those with public insurance only and $\$ 490$ for the uninsured. As expected, the uninsured also had the highest levels of out-of-pocket expenses for ambulatory services; they paid 41 percent of their expenses out of pocket, compared to 8 percent for those with public insurance and 18 percent for those with private insurance.

Among people age 65 and over, those with Medicare and supplemental private coverage were more likely than those with Medicare only to have ambulatory expenses ( 91 vs. 85 percent), and they had higher average expenses ( $\$ 1,604$ vs. $\$ 961$ ). Sources of payment also varied depending on insurance status for people 65 and over. In particular, those with Medicare only had the highest level of out-of-pocket spending (15 percent).

The percent of people with any ambulatory expenses tended to increase with income. There was little difference in average ambulatory expenses across most income groups. However, of people with expenses, those in the highest income group had significantly higher average expenses (\$986) than those with family incomes near ( $\$ 810$ ) or below ( $\$ 831$ ) the poverty level. As income increased, a smaller portion of ambulatory care was paid for by public sources and a larger portion was paid for by private insurance. Those in the high-income group paid somewhat more out of pocket ( 18 percent) than those in the low-income (15 percent) and poor groups (12 percent).

## Prescribed Medicines

Nearly two-thirds of the population incurred expenses for prescription medicines in 1996 (Table 5). The average annual expense for those incurring expenses was $\$ 406$. However, the median was only about one-quarter as large (\$107). Out-of-pocket spending and private insurance paid the bulk of these expenses: 45 and 40 percent, respectively. In contrast, Medicare and Medicaid combined paid a total of only about 12 percent of prescribed medicine expenses, most of which ( 10 percent) was paid by Medicaid.

## Demographic Characteristics

The population age 65 and over was much more likely to have a prescription medicine expense than the non-elderly population ( 87 vs. 62 percent) and had average expenses that were more than twice as large
( $\$ 825 \mathrm{vs}$. \$321). The elderly paid just over half of these expenses out of pocket ( 52 percent), compared with 41 percent for people under 65. Private insurance paid only 31 percent of expenses for the elderly, compared to 45 percent for the population under age 65. Medicaid paid for a larger percent of prescribed medicine expenses for children under 18 than for the older age groups.

Females were more likely than males to have a prescription medicine expense ( 71 percent compared to 59 percent). In addition, females had higher average annual expenses for those with expenses than males (\$434 vs. \$371).

About two-thirds of whites had prescription medicine expenses, compared to 56 percent of blacks and 54 percent of Hispanics. Whites with expenses also had higher mean annual expenses (\$430) than blacks ( $\$ 333$ ) or Hispanics (\$281). In addition, a higher proportion of expenses were paid out of pocket and by private insurance for whites than for blacks or Hispanics. Blacks and Hispanics had higher proportions of their prescribed medicine expenses paid by Medicaid (28 percent and 22 percent, respectively) than whites did (7 percent).

There was no significant difference between MSA and non-MSA areas in the percent of people with a prescribed medicine expense in 1996, but a small amount of variation existed among regions, ranging from 61 percent in the West to 68 percent in the Midwest. The mean annual expenses per person with expenses were highest in the South and Midwest.

In general, people in fair or poor health were more likely than people in better health to have a prescribed medicine expense and had higher average expenses. Among the population age 65 and over, approximately 94 percent of those in fair or poor health had a prescribed medicine expense in 1996, compared to 85 percent of those in excellent, very good, or good health. In addition, the elderly in fair or poor health had higher mean annual expenses $(\$ 1,133)$ than those in better health (\$703). For the population under 65 there were larger discrepancies by perceived health status; 84 percent of those in fair or poor health had a prescribed medicine expense, compared to 60 percent of those in better health, and average expenses for those groups were $\$ 844$ and $\$ 258$, respectively.

## Insurance and Income

In the population under 65, about two-thirds of people with public or private insurance, but only 41 percent of the uninsured, had expenses for prescription medicines. Non-elderly people with public insurance had higher mean annual expenses (\$408) than those with private insurance (\$318) or the uninsured (\$232). The uninsured paid 88 percent of their prescription expenses out of pocket, compared to 40 percent for those with private insurance and 27 percent for those with public insurance.

In the population age 65 and over, people with only Medicare coverage were the least likely to have prescription medicine expenses (79 percent). Among elderly people with expenses, those with Medicare and other public insurance had the highest mean annual expenditures $(\$ 1,048)$. Expenses paid out of pocket varied by type of insurance. People with Medicare only paid nearly three-fourths of their expenses out of pocket, compared to about half for those with Medicare and private insurance, and about one-fourth for those with Medicare and other public coverage. Medicaid paid 63 percent of expenses for those with Medicare and other public coverage, while private insurance paid 45 percent of expenses for those with Medicare and private insurance.

There was little variation by income group in the percent of the population with prescription medicine expenses or in average expenses. The proportion of prescribed medicine expenses paid by private insurance increased with income, rising from about 13 percent for the poor to just over half for those with high incomes ( 52 percent). As expected, the percent paid by Medicaid was highest for the poor (about 41 percent) and decreased steadily with increasing income. Out-ofpocket payments as a proportion of total prescribed medicine expenses were highest for the near-poor (53 percent) and lowest for the poor ( 39 percent).

## Dental Services

In 1996, less than half ( 42 percent) of the civilian noninstitutionalized population of the United States had dental care expenses (Table 6). The average and median expenses for those with an expense were $\$ 384$ and $\$ 136$ per year, respectively. The overwhelming majority of
dental expenses were paid either out of pocket (52 percent) or by private insurance (43 percent). Public programs were not a major source of payment for dental care. Medicare does not cover most dental services, and Medicaid paid for only about 3 percent of all dental services in 1996.

## Demographic Characteristics

Children under age 6 were the least likely to have any dental expenses ( 21 percent), and their average expenses were significantly less than those for any other age group. In contrast, children ages 6-17 were the most likely to have expenses for dental care (51 percent). The elderly paid the highest percent of dental expenses out of pocket ( 75 percent) and had the lowest percent reimbursed by private insurance ( 18 percent).

Females were slightly more likely to have dental expenses than males ( 45 percent vs. 39 percent), but average expenses did not vary significantly by sex. There were no differences between males and females in the distribution of payments by source.

Nearly half of whites had a dental expense (47 percent), compared to only one-quarter of blacks and 28 percent of Hispanics. Whites also had higher average expenses. Whites paid a slightly higher percent out of pocket ( 52 percent) than Hispanics ( 46 percent), but there were no differences by racial/ethnic background in the amount paid by private insurance. Medicaid paid a higher percentage of dental expenses for blacks (8 percent) and Hispanics ( 9 percent) than for whites ( 2 percent).

People living in metropolitan areas were slightly more likely to have a dental expense than people in nonmetropolitan areas (43 vs. 38 percent) and had higher average expenses (\$406 vs. \$282). The proportion of people with an expense ranged among regions from 37 percent in the South to 48 percent in the Midwest. Average dental expenses for those with an expense were greater in the Northeast and West than in the South and Midwest. People in the Northeast and South paid a higher proportion out of pocket (56 and 59 percent, respectively) than those in the Midwest and West (45 percent in both regions).

Among people under age 65, those in excellent, very good, or good health were more likely to have a dental expense ( 43 percent) than people in fair or poor health ( 34 percent). Although the average dental expense and the percent paid out of pocket were similar, the percent paid by private insurance was less for those
in fair or poor health ( 36 percent) than for those in better health (47 percent). Medicaid paid a significantly greater proportion of dental expenses for non-elderly people in fair or poor health ( 12 percent) than for those in excellent, very good, or good health (3 percent).

Health status was also associated with the likelihood of having a dental expense for people 65 years and over. About 44 percent of elderly people in excellent, very good, or good health had an expense, compared to only 27 percent of those in fair or poor health. For both the non-elderly and elderly populations, average dental expenses for those with expenses did not differ significantly across health status groups.

## Insurance and Income

Among people under age 65, those with private insurance were more likely to have a dental expense (49 percent) than those with public coverage only (27 percent) or without health insurance (19 percent). Average expenses for those with an expense were much lower for people with public coverage only (\$207) than for those with any private insurance ( $\$ 390$ ) or the uninsured (\$362). The proportion of dental expenses paid out of pocket was more than three times higher for the uninsured ( 79 percent) than for those with public coverage only ( 26 percent) and was 1.7 times greater for the uninsured than for those with any private insurance (47 percent).

Private insurance was also associated with an increased likelihood of having a dental expense among people 65 years and over. Forty-six percent of the elderly with a combination of Medicare and private insurance had dental care expenses, about three times the rate for people with Medicare and other public coverage ( 15 percent) and 1.6 times the rate for those with only Medicare coverage ( 30 percent).

Generally, the percent of people with an expense and average expenses tended to increase with income. Only about one-quarter of people in the poor and nearpoor categories had a dental expense, compared to over half of people with high incomes ( 55 percent). Of all income groups, the high- and middle-income groups had the highest average expenses (\$424 and \$392, respectively). The percent paid by private insurance also generally increased with family income. Medicaid paid for about one-third of dental expenses for the poor (32 percent) and 14 percent for the near-poor. The percent paid out of pocket did not vary by income group.

## Home Health Services

Only a small proportion (about 2 percent) of the population had home health expenses in 1996 (Table 7). Expenses per person for those individuals were relatively high, however, averaging about \$5,200 for the year, with a median of $\$ 1,540$. The majority of home health expenses were paid for by Medicare ( 53 percent), followed by Medicaid (16 percent) and out-of-pocket spending (12 percent). Private insurance accounted for approximately 9 percent of total payments, and other public programs for another 9 percent.

## Demographic Characteristics

The elderly were by far the most likely to have home health expenses. Thirteen percent of people age 65 and over had expenses for home health care, compared with less than 1 percent of people under age 65. In addition, the average annual expense per person for those with expenses was much higher for the elderly than the non-elderly ( $\$ 6,041$ vs. $\$ 3,342$ ). As would be expected, Medicare was the primary source of payment for home health services for the elderly, covering almost 60 percent of all payments, but it was also a major source of payment for the population under 65, covering more than one-quarter of the payments for this group. The elderly paid a relatively large proportion of home health care expenses out of pocket ( 15 percent) but had less than 5 percent of their expenses covered by private insurance.

Females were more likely than males to have home health expenses, but average expenses per person with any expense did not differ significantly by sex. Among racial and ethnic groups, Hispanics were the least likely to have home health expenses; there was no difference between blacks and whites in the probability of incurring expenses. Not surprisingly, among both the non-elderly and the elderly, people in fair or poor health were far more likely than those in good to excellent health to have expenses for home health services. Among those 65 and over, average expenses per person with expenses were more than $1 \frac{1}{2}$ times as high for those in fair or poor health as for those in better health (\$7,365 vs. \$4,321).

People living outside of MSAs were slightly more likely to have home health expenses than those living in MSAs and also had a higher proportion of their expenses paid for by Medicare ( 68 vs. 48 percent). There were no significant differences by region in the
percent of people with an expense, mean expenses, or the distribution of mean expenses across sources of payment, at least partly because of small sample sizes.

## Insurance and Income

Non-elderly people with public insurance were approximately five times as likely as the non-elderly with private insurance to incur expenses for home health care. Elderly people with both Medicare and other public insurance were nearly three times as likely as those with Medicare only or Medicare and private insurance to incur expenses for home health care. In addition, the average annual expense per person with an expense was nearly twice as high for people with Medicare and other public insurance $(\$ 9,984)$ as it was for those who had Medicare and private insurance (\$5,550).

High-income people were less likely than the poor or near-poor to have home health expenses. The average expense per person with an expense was significantly higher for poor people than for high-income people, and the poor had a much higher proportion of expenses paid for by Medicare. There were few other significant differences by income, largely because of small sample sizes.

## Other Medical Equipment and Services

In 1996, about one out of five people had expenses for other medical equipment and services (Table 8), totaling $\$ 15.3$ billion. The mean and median expenses for those with expenses were $\$ 286$ and $\$ 158$, respectively. Over half of all expenses ( 54 percent) were paid out of pocket, while private insurance paid 28 percent.

The elderly were more likely than the non-elderly to have other medical expenses ( 33 percent vs. 18 percent), and they had higher average expenses among those with an expense ( $\$ 432$ vs. $\$ 248$ ). The elderly with Medicare only paid a significantly higher proportion out of pocket (60 percent) than the elderly with Medicare and either other public insurance ( 29 percent) or private insurance (44 percent). In addition, whites were more likely to have other medical expenses than either blacks or Hispanics ( 22 percent vs. 13 percent for both blacks and Hispanics). Among both the elderly and non-elderly, those in poor or fair health were more likely to have
other medical expenses, and paid a significantly smaller portion out of pocket, than those in better health. Finally, high-income people were more likely than poor people to have an expense ( 24 percent vs. 14 percent) and paid a much larger percentage out of pocket ( 59 percent vs. 37 percent).

## Summary

In 1996, 86 percent of the U.S. civilian noninstitutionalized population incurred health care expenses. Aggregate expenses totaled $\$ 554$ billion. The average expense per person with any medical expense was about $\$ 2,400$, but half of these individuals had expenses totaling less than $\$ 559$ (the median value). Average expenses varied considerably across the population by age, race/ethnicity, health insurance status, and health status. For example, the average expense for uninsured people with expenses was less than half the average expense for those with private or public health insurance.

Hospital inpatient care, despite declining substantially as a proportion of total expenses over the last two decades (Hahn and Lefkowitz, 1992), was still the largest component of health care expenses in 1996, making up 38 percent of the total. The second largest category of expenses in 1996, ambulatory services from both physicians and nonphysician providers, accounted for approximately one-third of the total. The proportion of expenses attributable to purchases of prescription medicines was 13 percent in 1996, a substantial increase over the proportion a decade earlier (Hahn and Lefkowitz, 1992).

Private insurance was the largest source of payments in 1996, comprising 45 percent of total expenses, while Medicare accounted for 21 percent and Medicaid 9 percent. The proportion of total expenses paid out of pocket, which has declined in recent years (Hahn and Lefkowitz, 1992), was about 18 percent in 1996. The proportion paid by different sources varied considerably by type of service. For example, 45 percent of prescription medicine expenses and 52 percent of dental expenses were paid out of pocket, compared to only 2 percent for inpatient services.

In summary, MEPS data for 1996 indicate that levels of expenses and the distribution of payments by source varied by both type of service and characteristics of the population. The estimates presented here represent the first in a series of annual estimates based
on the ongoing Medical Expenditure Panel Survey. Future MEPS surveys will allow for a more thorough examination of trends in total health care expenses and the distribution of those expenses and sources of payment across the population.

| Home health $^{\mathrm{f}}$ | N A | 50.2 | 43.1 | 12.9 |
| Other medical $^{\text {g }}$ | N A | 43.4 | 34.1 | 7.8 |

${ }^{\text {a }}$ Total includes inpatient hospital and physician services, ambulatory physician and nonphysician services, prescribed medicines, home health services, dental services, and various other medical equipment, supplies, and services that were purchased or rented during the year. Over-the-counter medications, alternative care services, and phone contacts are excluded.
${ }^{\mathrm{b}}$ Hospital admissions that did not involve an overnight stay are excluded but are counted as ambulatory events. Expenses include room and board and all hospital diagnostic and laboratory expenses associated with the basic facility charge, payments for separately billed physician inpatient services, and emergency room expenses incurred immediately prior to inpatient stays. Events for newborns who left the hospital on the same day as the mother are treated as separate events, but associated expenses are included in expense estimates.
${ }^{\text {c }}$ Events and expenses for both physician and nonphysician medical providers seen in office-based settings or clinics, hospital outpatient departments, emergency rooms (except visits resulting in an overnight hospital stay), and clinics owned and operated by hospitals are included, as are events and expenses for hospital admissions without an overnight stay.
${ }^{\mathrm{d}}$ All prescribed medicines initially purchased or otherwise obtained during 1996, as well as refills and free samples, are included.
${ }^{\mathrm{e}}$ Services provided by general dentists, dental hygienists, dental technicians, dental surgeons, orthodontists, endodontists, and periodontists are included.
${ }^{\mathrm{f}}$ Expenses for care provided by home health agencies and independent home health providers are included. Most home health expenses ( 82.5 percent) were for agency providers.
${ }^{\mathrm{g}}$ Expenses for eyeglasses, ambulance services, orthopedic items, hearing devices, prostheses, bathroom aids, medical equipment, disposable supplies, and other miscellaneous items or services that were obtained, purchased, or rented during the year are included.

NA—not available.
Note: These estimates are for a target population of approximately 268.9 million persons who were in the civilian noninstitutionalized population for all or part of 1996 . Percents may not add to 100 because of rounding.

${ }^{\mathrm{e}}$ For source of payment, private includes CHAMPUS and CHAMPVA (Armed-Forces-related coverage).
${ }^{\mathrm{f}}$ For source of payment, other public includes Department of Veterans Affairs (except CHAMPVA); other Federal sources (Indian Health Service, military treatment facilities, and other care provided by the Federal Government); other State and local sources (community and neighborhood clinics, State and local health departments, and State programs other than Medicaid); and other public (Medicaid payments reported for persons who were not enrolled in the Medicaid program at any time during the year).
${ }^{\mathrm{g}}$ For source of payment, other includes Worker's Compensation; other unclassified sources (e.g., automobile, homeowner's, liability, and other miscellaneous or unknown sources); and other private insurance (any type of private insurance payments reported for persons without private health insurance coverage during the year, as defined in MEPS).
-Less than 100 sample cases with expenses.
*Relative standard error equal to or greater than 30 percent.
Note: Restricted to civilian noninstitutionalized population. Percents may not add to 100 because of rounding.

## Technical Appendix

The data in this report were obtained in the first three rounds of interviews for the Household Component (HC) of the 1996 Medical Expenditure Panel Survey (MEPS). MEPS is cosponsored by the Agency for Healthcare Research and Quality (AHRQ) and the National Center for Health Statistics (NCHS). The focus of the MEPS HC is to collect detailed data on demographic characteristics, health conditions, health status, use of medical care services, charges and payments for those services, access to care, health insurance coverage, income, and employment of the U.S. civilian noninstitutionalized population. In other components of MEPS, data are collected on the use, charges, and payments reported by providers (Medical Provider Component), residents of licensed or certified nursing homes (Nursing Home Component), and the supply side of the insurance market (Insurance Component).

The sample for the MEPS HC was selected from respondents to the 1995 National Health Interview Survey (NHIS), which was conducted by NCHS. NHIS provides a nationally representative sample of the U.S. civilian noninstitutionalized population and reflects an oversampling of Hispanics and blacks. The MEPS HC collects data through an overlapping panel design. In this design, data are collected through a precontact interview that is followed by a series of five rounds of interviews over a period of $2 \frac{1}{2}$ years. Interviews are conducted with one member of each family, who reports on the health care experiences of the entire family. Two calendar years of medical expenditure and utilization data are collected in each household and captured using computer-assisted personal interviewing (CAPI). This series of data collection rounds is launched again each subsequent year on a new sample of households to provide overlapping samples of survey data that will provide continuous and current estimates of health care expenditures.

The reference period for Round 1 of the MEPS HC was from January 1, 1996, to the date of the first interview, which occurred during the period from March through August 1996. The reference period for Round 2 of the MEPS HC was from the date of the first interview (March-August 1996) to the date of the second interview, which took place during the period from August through December 1996. While the reference period for Round 3 was from the date of the
second interview (August-December 1996) to the date of the third interview (February-July 1997), only expenditures from the 1996 portion of the Round 3 interview are included in the estimates contained in this report.

The estimates of total expenditures in each table are based on 21,571 sample persons. They are weighted to develop population estimates for a total of 268,905,490 persons who were in the U.S. civilian noninstitutionalized population for part or all of 1996. For persons who were in the target population for the full year, all expenditures from January 1 through December 31, 1996, were included in the estimates. People with part-year information include newborns, people who died during the year, and people who resided in an institution, were in the military, or lived outside the country for part of the year. Expenditures for deceased persons were measured for the period from January 1 through the date of death, while those for newborns were measured from the date of birth through December 31. Expenses incurred during periods of fulltime active-duty military service, institutionalization, or residency outside the country were not included.

The estimates in this report are based on the most recent data available from MEPS at the time the report was written. However, selected elements of MEPS data may be revised on the basis of additional analyses, which could result in slightly different estimates from those shown here. Please check the MEPS Web site for the most current file releases.

## MEPS Expenditures

## Definition

Expenditures in this report refer to payments for health care services. More specifically, expenditures in MEPS are defined as the sum of direct payments for care provided during the year, including out-of-pocket payments and payments by private insurance, Medicaid, Medicare, and other sources. Payments for over-thecounter drugs, alternative care services, and phone contacts with medical providers are not included in MEPS total expenditure estimates. Indirect payments not related to specific medical events, such as Medicaid Disproportionate Share and Medicare Direct Medical Education subsidies, also are not included.

The definition of expenditures used in MEPS is somewhat different from the definition used in its predecessor surveys, the 1987 National Medical Expenditure Survey (NMES) and the 1977 National Medical Care Expenditure Survey (NMCES), where "charges" rather than "sum of payments" were used to measure expenditures. This change was adopted because charges became a less appropriate proxy for medical expenditures during the 1990s due to the increasingly common practice of discounting charges. One impact of this change is that charges associated with uncollected liability, bad debt, and charitable care (unless provided by a public clinic or hospital) are not counted as expenditures.

## Differences Between MEPS and National Health Accounts Estimates

MEPS and the National Health Accounts (NHA) of the Health Care Financing Administration (HCFA) have substantial differences in methodologies and objectives. In particular, the NHA are based on a composite of data from multiple sources at the national level and are used primarily to track aggregate medical expenditures in the U.S. economy. In contrast, MEPS collects survey data on individuals that can be used to estimate direct payments made for medical care and services purchased by the civilian noninstitutionalized population. Data from MEPS are widely used for behavioral and socioeconomic analyses of the relationship between individual characteristics and health care spending.

National health care expenditure estimates from MEPS are lower than those from the NHA for several reasons. First, the NHA include a larger range of expenditures. For example, the NHA include expenditures for over-the-counter drugs, nursing home care, program administration, government public health activities, and construction, as well as some hospital and physician revenues not associated with patient care. Second, the NHA include health care expenditures for individuals who are not members of the civilian noninstitutionalized population, such as individuals in the military and those residing in nursing homes, assisted living facilities, and prisons. Researchers at AHRQ and HCFA estimate that adjustments for differences in the scope of included expenditures and population reduce the NHA's national estimate to about $\$ 604$ billion, compared to the corresponding MEPS national estimate of $\$ 554$ billion (Selden, Levit, Cohen,
et al., 2000). For the most part, the remaining difference is likely to reflect some combination of (a) irreconcilable definition and measurement differences between the NHA and MEPS and (b) statistical uncertainty associated with sampling error in both MEPS and the NHA.

## Estimation Methodology

Expenditure estimates in this report are based on the sum of total payments for 1996 medical events reported in Rounds 1-3 of the MEPS HC. The HC collected annual data on the use of and associated expenditures for office and hospital-based care, home health care, dental services, prescribed medicines, vision aids, and other medical supplies and equipment. In addition, the MEPS Medical Provider Component (MPC) collected expenditure data from a sample of medical and pharmaceutical providers that provided care and medicines to sample people in 1996. Expenditure data collected in the MPC are generally regarded as more accurate than comparable data collected in the HC and were used to improve the overall quality of MEPS expenditure data in this report. For a more detailed description of the MPC, see Machlin and Taylor (2000).

Expenditure data were imputed to replace missing data, provide estimates for care delivered under capitated reimbursement arrangements, and adjust household-reported insurance payments because respondents were often unaware that their insurer paid a discounted amount to the provider. This section contains a general description of the approaches used for these three situations. A more detailed description of the editing and imputation procedures is provided in the documentation for the MEPS event-level files, which are available through the AHRQ Web site at http://www.ahrq.gov/. For more information on the approach used to impute missing expenditure data on prescribed medicines, see Moeller, Stagnitti, Horan, et al. (2000).

Missing data on expenditures were imputed using a weighted sequential hot-deck procedure for most medical visits and services. In general, this procedure imputes data from events with complete information to events with missing information but similar characteristics. For each event type, selected predictor variables with known values (e.g., total charge; demographic characteristics; region; provider type; and characteristics of the event of care, such as whether it
involved surgery) were used to form groups of donor events with known data on expenditures, as well as identical groups of recipient events with missing data. Within such groups, data were assigned from donors to recipients, taking into account the weights associated with the complex MEPS survey design. Only MPC data were used as donors for hospital-based events, while data from both the HC and MPC were used as donors for office-based physician visits.

Because payments for medical care provided under capitated reimbursement arrangements and through public clinics and Department of Veterans Affairs (VA) hospitals are not tied to particular medical events, expenditures for events covered under those types of arrangements and settings were also imputed. Events covered under capitated arrangements were imputed from events covered under managed care arrangements that were paid based on a discounted fee-for-service method, while imputations for visits to public clinics and VA hospitals were based on similar events that were paid on a fee-for-service basis. As for other events, selected predictor variables were used to form groups of donor and recipient events for the imputations.

An adjustment also was applied to some HCreported expenditure data because an evaluation of matched HC/MPC data showed that respondents who reported that charges and payments were equal were often unaware that insurance payments for the care had been based on a discounted charge. To compensate for this systematic reporting error, a weighted sequential hot-deck imputation procedure was implemented to determine an adjustment factor for HC-reported insurance payments when charges and payments were reported to be equal.

In some situations, it was reported that one charge covered multiple contacts between a sample person and a medical provider (e.g., obstetrical services, orthodontia). In these situations, total payments for the fee (sometimes called a flat or global fee) were included if the initial service was provided in 1996. For example, all payments for an orthodontist's fee that covered multiple visits over 3 years were included if the initial visit occurred in 1996. However, if a 1996 visit to an orthodontist was part of a flat fee for which the initial visit occurred in 1995, then none of the payments for the flat fee were included. Most of the expenditures for medical care reported by MEPS participants were associated with medical events that were not part of a flat-fee arrangement.

Respondents sometimes reported medical events for which, in actuality, no payments were made. This situation could occur for several reasons, including when free care or a free sample of medicine was provided, bad debt was incurred, or no charge was made for a followup visit (e.g., after a surgical procedure).
These types of events were treated as valid $\$ 0$ payments when developing the estimates contained in this report.

## Type-of-Service Categories

In addition to expenditures for total health services (Table 2), expenses are classified in this report into six broad types of service: hospital inpatient, ambulatory, prescribed medicines, dental, home health, and other medical equipment and services. These categories are described below and, where relevant, in the footnotes to the tables in this report.

- Hospital inpatient services (Table 3)-This category includes room and board and all hospital diagnostic and laboratory expenses associated with the basic facility charge, payments for separately billed physician inpatient services, and emergency room expenses incurred immediately prior to inpatient stays. It excludes expenses for hospital discharges that did not involve an overnight stay, which are classified as ambulatory expenses.
- Ambulatory services (Table 4)-This category includes expenses for visits to medical providers seen in office-based settings or clinics, hospital outpatient departments, emergency rooms (except visits resulting in an overnight hospital stay), and clinics owned and operated by hospitals. It also includes expenses for events reported as hospital admissions without an overnight stay.
- Prescribed medicines (Table 5)-This category includes expenses for all prescribed medications that were initially purchased or otherwise obtained during 1996, as well as any refills.
- Dental services (Table 6)-This category covers expenses for any type of dental care provider, including general dentists, dental hygienists, dental technicians, dental surgeons, orthodontists, endodontists, and periodontists.
- Home health services (Table 7)-This category includes expenses for care provided by home health agencies and independent home health providers.

Agency providers accounted for most (about 83 percent) of the expenses in this category.

- Other medical equipment and services (Table 8)This category includes expenses for eyeglasses, contact lenses, ambulance services, orthopedic items, hearing devices, prostheses, bathroom aids, medical equipment, disposable supplies, and other miscellaneous items or services that were obtained, purchased, or rented during the year. About half the expenditures in this category were for vision items.

## Source-of-Payment Categories

Estimates of sources of payment presented in this report represent the percentage of the total sum of expenditures paid for by each source. Sources of payment are classified as follows.

- Out of pocket by user or family.
- Private insurance-Includes payments made by insurance plans covering hospital and medical care (excluding payments from Medicare, Medicaid, and other public sources). Payments from Medigap plans or CHAMPUS and CHAMPVA (Armed-Forcesrelated coverage) are included. Payments from plans that provide coverage for a single service only, such as dental or vision coverage, are not included.
- Medicare-A federally financed health insurance plan for the elderly, persons receiving Social Security disability payments, and most persons with end-stage renal disease. Medicare Part A, which provides hospital insurance, is automatically given to those who are eligible for Social Security. Medicare Part B provides supplementary medical insurance that pays for medical expenses and can be purchased for a monthly premium.
- Medicaid-A means-tested government program jointly financed by Federal and State funds that provides health care to those who are eligible. Program eligibility criteria vary significantly by State, but the program is designed to provide health coverage to families and individuals who are unable to afford necessary medical care.
- Other public programs-Includes payments from the Department of Veterans Affairs (excluding CHAMPVA); other Federal sources (Indian Health Service, military treatment facilities, and other care provided by the Federal Government); various State and local sources (community and neighborhood
clinics, State and local health departments, and State programs other than Medicaid); and Medicaid payments reported for people who were not enrolled in the Medicaid program at any time during the year.
- Other sources-Includes payments from Worker's Compensation; other unclassified sources (automobile, homeowner's, or liability insurance, and other miscellaneous or unknown sources); and other private insurance (any type of private insurance payments reported for people without private health insurance coverage during the year as defined in MEPS).

## Population Characteristics

In general, estimates in this report are based on characteristics as of December 31, 1996, or the last date that the sample person was part of the civilian noninstitutionalized population living in the United States prior to December 31, 1996.

## Age

The respondent was asked to report the age of each family member as of the date of each interview for Rounds 1,2 , and 3 . In this report, age is usually based on the sample person's age as of December 31, 1996. If data were not collected during Round 3 because the sample person was out of scope (e.g., deceased or institutionalized), then age at the time of the Round 2 interview was used. Similarly, if age at Round 2 was not collected because the person was out of scope, then age at Round 1 was used.

## Race/Ethnicity

Classification by race and ethnicity is based on information reported for each family member. Respondents were asked if the race of the sample person was best described as American Indian, Alaska Native, Asian or Pacific Islander, black, white, or other. They also were asked if the sample person's main national origin or ancestry was Puerto Rican; Cuban; Mexican, Mexicano, Mexican American, or Chicano; other Latin American; or other Spanish. All persons whose main national origin or ancestry was reported in one of these Hispanic groups, regardless of racial background, are classified as Hispanic. Since the Hispanic grouping can include black Hispanic, white Hispanic, and other

Hispanic, the race categories of black, white, and other do not include Hispanic people.

## Health Insurance Status

Individuals under age 65 were classified into the following three insurance categories based on household responses to health insurance status questions administered during Rounds 1-3 of the MEPS HC.

- Any private health insurance-Individuals who, at any time during the year, had insurance that provides coverage for hospital and physician care (other than Medicare, Medicaid, or other public hospital/physician coverage) are classified as having private insurance. Coverage by CHAMPUS/CHAMPVA (Armed-Forces-related coverage) is also included as private health insurance. Insurance that provides coverage for a single service only, such as dental or vision coverage, is not included.
- Public coverage only-Individuals are considered to have public coverage only if they met both of the following criteria:
- They were not covered by private insurance at any time during the year.
- They were covered by one of the following public programs at any point during the year: Medicare, Medicaid, or other public hospital/physician coverage.
- Uninsured-The uninsured are defined as people not covered by Medicare, CHAMPUS/CHAMPVA, Medicaid, other public hospital/physician programs, or private hospital/physician insurance at any time during the entire year or period of eligibility for the survey. Individuals covered only by noncomprehensive State-specific programs (e.g., Maryland Kidney Disease Program, Colorado Child Health Plan) or private single-service plans (e.g., coverage for dental or vision care only, coverage for accidents or specific diseases) are not considered to be insured.
Individuals age 65 and over were classified into the following three insurance categories:
- Medicare only.
- Medicare and private.
- Medicare and other public.

## Poverty Status

Each sample person was classified according to the total 1996 income of his or her family. Within a household, all individuals related by blood, marriage, or adoption were considered to be a family. Personal income from all family members was summed to create family income. Possible sources of income included annual earnings from wages, salaries, bonuses, tips, and commissions; business and farm gains and losses; unemployment and Worker's Compensation; interest and dividends; alimony, child support, and other private cash transfers; private pensions, individual retirement account (IRA) withdrawals, Social Security, and Department of Veterans Affairs payments; Supplemental Security Income and cash welfare payments from public assistance, Aid to Families with Dependent Children and Aid to Dependent Children; gains or losses from estates, trusts, partnerships, S corporations, rent, and royalties; and a small amount of "other" income.

Poverty status is the ratio of family income to the 1996 Federal poverty thresholds, which control for family size and age of the head of family. Categories are defined as follows:

- Poor-This refers to persons in families with income less than or equal to the poverty line and includes those who reported negative income.
- Near-poor-This group includes persons in families with income over the poverty line through 125 percent of the poverty line.
- Low income-This category includes persons in families with income over 125 percent through 200 percent of the poverty line.
- Middle income-This category includes persons in families with income over 200 percent through 400 percent of the poverty line.
- High income-This category includes persons in families with income over 400 percent of the poverty line.

## Place of Residence

Individuals are identified as residing either inside or outside a metropolitan statistical area (MSA) as designated by the U.S. Office of Management and Budget, which applied 1990 standards using population counts from the 1990 U.S. census. An MSA is a large population nucleus combined with adjacent communities that have a high degree of economic and
social integration with the nucleus. Each MSA has one or more central counties containing the area's main population concentration. In New England, metropolitan areas consist of cities and towns rather than whole counties. MSA data are based on MSA status as of December 31, 1996. If MSA status as of December 31 was not known, then MSA status at the time of the Round 3 interview was used.

## Region

Each MEPS sample person was classified as living in one of the following four regions as defined by the Bureau of the Census:

- Northeast-Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, and Pennsylvania.
- Midwest-Ohio, Indiana, Illinois, Michigan, Wisconsin, Minnesota, Iowa, Missouri, North Dakota, South Dakota, Nebraska, and Kansas.
- South-Delaware, Maryland, District of Columbia, Virginia, West Virginia, North Carolina, South Carolina, Georgia, Florida, Kentucky, Tennessee, Alabama, Mississippi, Arkansas, Louisiana, Oklahoma, and Texas.
- West-Montana, Idaho, Wyoming, Colorado, New Mexico, Arizona, Utah, Nevada, Washington, Oregon, California, Alaska, and Hawaii.

## Perceived Health Status

The MEPS respondent was asked to rate the health of each person in the family at the time of the Round 1 and Round 2 interviews according to the following categories: excellent, very good, good, fair, and poor. Perceived health status in this report is based primarily on responses obtained in the Round 2 interview. For persons with missing health status in Round 2, however, the response for health status at Round 1 was used, if available. In the tables in this report, the five health status categories were collapsed into the following two broad categories: (1) excellent, very good, or good health and (2) fair or poor health.

## Sample Design and Accuracy of Estimates

The sample selected for the 1996 MEPS, a subsample of the 1995 NHIS, was designed to produce national estimates that are representative of the civilian noninstitutionalized population of the United States. Round 1 data were obtained for approximately 9,400 households in MEPS, resulting in a survey response rate of 78 percent. This figure reflects participation in both NHIS and MEPS. For Round 2, the response rate was 95 percent, resulting in a response rate of 74 percent overall from the NHIS interview through Round 2 of MEPS. For Round 3, the response rate was 95 percent, resulting in a full-year response rate of 70 percent.

The statistics presented in this report are affected by both sampling error and sources of nonsampling error, which include nonresponse bias, respondent reporting errors, and interviewer effects. For a detailed description of the MEPS survey design, the adopted sample design, and methods used to minimize sources of nonsampling error, see J. Cohen (1997), S. Cohen (1997), and Cohen, Monheit, Beauregard, et al. (1996).

The MEPS person-level estimation weights include nonresponse adjustments and poststratification adjustments to population totals obtained from the March 1997 Current Population Survey (CPS) to reflect Census Bureau estimated population distributions as of December 1996. The person-level poststratification incorporated the following variables: poverty status, region, MSA, race/ethnicity, sex, and age. The weighting process also included poststratification to population totals obtained from the 1996 Medicare Current Beneficiary Survey (MCBS) for the number of deaths among Medicare beneficiaries in 1996, and poststratification to population totals obtained from the 1996 MEPS Nursing Home Component for the number of individuals admitted to nursing homes.

Overall, the weighted population estimate for the civilian noninstitutionalized population as of December 31,1996 , is $265,439,511$. The inclusion of people who were in scope at some time in 1996 but were out of scope (deceased, institutionalized, active-duty military, or out of the country) as of December 31, 1996, brings the estimated total number of people represented by MEPS respondents over the course of the year up to 268,905,490.

## HAEP

Tests of statistical significance were used to determine whether the differences between populations exist at specified levels of confidence or whether they occurred by chance. Differences were tested using Zscores having asymptotic normal properties at the 0.05 level of significance. Unless otherwise noted, only statistically significant differences between estimates are discussed in the text.

## Rounding

Estimates presented in the tables are rounded as follows:

- Percentages are rounded to the nearest 0.1 percentage point.
- Mean and median expenditures are rounded to the nearest dollar.
- Total expenditures are rounded to the nearest million dollar unit.
Some of the estimates for population totals of subgroups presented in the tables will not add exactly to the overall estimated population total as a consequence of rounding.

Rockville, MD 20852

Official Business
Penalty for Private Use \$300

[^0]:    ${ }^{a}$ Inpatient hospital and physician services, ambulatory physician and nonphysician services, prescribed medicines, home health services, dental services, and various other medical equipment and services that were purchased or rented during the year are included. Over-the-counter medications, alternative care services, and telephone contacts are excluded.
    ${ }^{\mathrm{b}}$ For health insurance status, uninsured refers to persons uninsured during the entire year. Public and private health insurance categories refer to individuals with public or private insurance at any time during the period; individuals with both public and private insurance and those with CHAMPUS or CHAMPVA (Armed-Forces-related coverage) are classified as having private insurance.
    ${ }^{c}$ Number of persons and amount of expenses do not add to overall total because data on this variable were not available for some sample persons.
    ${ }^{\mathrm{d}}$ Poor refers to incomes at or below the Federal poverty line; near-poor, over the poverty line through 125 percent of the poverty line; low income, over 125 percent through 200 percent of the poverty line; middle income, over 200 percent to 400 percent of the poverty line; and high income, over 400 percent of the poverty line.

[^1]:    ${ }^{\mathrm{e}}$ For source of payment, private includes CHAMPUS and CHAMPVA (Armed-Forces-related coverage).
    ${ }^{\mathrm{f}}$ For source of payment, other public includes Department of Veterans Affairs (except CHAMPVA); other Federal sources (Indian Health Service, military treatment facilities, and other care provided by the Federal Government); other State and local sources (community and neighborhood clinics, State and local health departments, and State programs other than Medicaid); and other public (Medicaid payments reported for persons who were not enrolled in the Medicaid program at any time during the year).
    ${ }^{g}$ For source of payment, other includes Worker's Compensation; other unclassified sources (e.g., automobile, homeowner's, liability, and other miscellaneous or unknown sources); and other private insurance (any type of private insurance payments reported for persons without private health insurance coverage during the year, as defined in MEPS).
    *Relative standard error equal to or greater than 30 percent.
    Note: Restricted to civilian noninstitutionalized population. Percents may not add to 100 because of rounding.
    Source: Center for Cost and Financing Studies, Agency for Healthcare Research and Quality: Medical Expenditure Panel Survey, 1996.

[^2]:    ${ }^{\text {a }}$ Room and board and all hospital diagnostic and laboratory expenses associated with the basic facility charge, payments for separately billed physician inpatient services, and emergency room expenses incurred immediately prior to inpatient stays are included. Expenses for hospital discharges that did not involve an overnight stay, which are included as ambulatory expenses (Table 4) are excluded. Expenses for newborns who left the hospital on the same day as the mother are included in the mother's record.
    ${ }^{\mathrm{b}}$ For health insurance status, uninsured refers to persons uninsured during the entire year. Public and private health insurance categories refer to individuals with public or private insurance at any time during the period; individuals with both public and private insurance and those with CHAMPUS or CHAMPVA (Armed-Forces-related coverage) are classified as having private insurance.
    ${ }^{c}$ Number of persons and amount of expenses do not add to overall total because data on this variable were not available for some sample persons.
    ${ }^{d}$ Poor refers to incomes at or below the Federal poverty line; near-poor, over the poverty line through 125 percent of the poverty line; low income, over 125 percent through 200 percent of the poverty line; middle income, over 200 percent to 400 percent of the poverty line; and high income, over 400 percent of the poverty line.

[^3]:    ${ }^{\text {a }}$ Expenses for visits to medical providers seen in office-based settings or clinics, hospital outpatient departments, emergency rooms (except visits resulting in an overnight hospital stay), and clinics owned and operated by hospitals, as well as expenses for events reported as hospital admissions without an overnight stay, are included.
    ${ }^{\mathrm{b}}$ For health insurance status, uninsured refers to persons uninsured during the entire year. Public and private health insurance categories refer to individuals with public or private insurance at any time during the period; individuals with both public and private insurance and those with CHAMPUS or CHAMPVA (Armed-Forces-related coverage) are classified as having private insurance.
    ${ }^{c}$ Number of persons and amount of expenses do not add to overall total because data on this variable were not available for some sample persons.
    ${ }^{\mathrm{d}}$ Poor refers to incomes at or below the Federal poverty line; near-poor, over the poverty line through 125 percent of the poverty line; low income, over 125 percent through 200 percent of the poverty line; middle income, over 200 percent to 400 percent of the poverty line; and high income, over 400 percent of the poverty line.

[^4]:    ${ }^{\mathrm{e}}$ For source of payment, private includes CHAMPUS and CHAMPVA (Armed-Forces-related coverage)
    ${ }^{\mathrm{f}}$ For source of payment, other public includes Department of Veterans Affairs (except CHAMPVA); other Federal sources (Indian Health Service, military treatment facilities, and other care provided by the Federal Government); other State and local sources (community and neighborhood clinics, State and local health departments, and State programs other than Medicaid); and other public (Medicaid payments reported for persons who were not enrolled in the Medicaid program at any time during the year).
    ${ }^{\mathrm{g}}$ For source of payment, other includes Worker's Compensation; other unclassified sources (e.g., automobile, homeowner's, liability, and other miscellaneous or unknown sources); and other private insurance (any type of private insurance payments reported for persons without private health insurance coverage during the year, as defined in MEPS).
    *Relative standard error equal to or greater than 30 percent.
    Note: Restricted to civilian noninstitutionalized population. Percents may not add to 100 because of rounding.
    Source: Center for Cost and Financing Studies, Agency for Healthcare Research and Quality: Medical Expenditure Panel Survey, 1996.

[^5]:    ${ }^{a}$ Expenses for all prescribed medicines initially purchased or otherwise obtained during 1996, as well as any refills, are included. Free samples are included in the estimate of percent of persons with any expense.
    ${ }^{\mathrm{b}}$ For health insurance status, uninsured refers to persons uninsured during the entire year. Public and private health insurance categories refer to individuals with public or private insurance at any time during the period; individuals with both public and private insurance and those with CHAMPUS or CHAMPVA (Armed-Forces-related coverage) are classified as having private insurance.
    ${ }^{c}$ Number of persons and amount of expenses do not add to overall total because data on this variable were not available for some sample persons
    ${ }^{d}$ Poor refers to incomes at or below the Federal poverty line; near-poor, over the poverty line through 125 percent of the poverty line; low income, over 125 percent through 200 percent of the poverty line; middle income, over 200 percent to 400 percent of the poverty line; and high income, over 400 percent of the poverty line.

[^6]:    ${ }^{\text {a }}$ Expenses from any type of dental care providers are included.
    ${ }^{\mathrm{b}}$ For health insurance status, uninsured refers to persons uninsured during the entire year. Public and private health insurance categories refer to individuals with public or private insurance at any time during the period; individuals with both public and private insurance and those with CHAMPUS or CHAMPVA (Armed-Forces-related coverage) are classified as having private insurance.
    ${ }^{c}$ Number of persons and amount of expenses do not add to overall total because data on this variable were not available for some sample persons
    ${ }^{\mathrm{d}}$ Poor refers to incomes at or below the Federal poverty line; near-poor, over the poverty line through 125 percent of the poverty line; low income, over 125 percent through 200 percent of the poverty line; middle income, over 200 percent to 400 percent of the poverty line; and high income, over 400 percent of the poverty line.

[^7]:    ${ }^{a}$ Expenses for care provided by home health agencies and independent home health providers are included. Most home health expenses ( 82.5 percent) were for agency providers.
    ${ }^{\mathrm{b}}$ For health insurance status, uninsured refers to persons uninsured during the entire year. Public and private health insurance categories refer to individuals with public or private insurance at any time during the period; individuals with both public and private insurance and those with CHAMPUS or CHAMPVA (Armed-Forces-related coverage) are classified as having private insurance.
    ${ }^{c}$ Number of persons and amount of expenses do not add to overall total because data on this variable were not available for some sample persons
