## **Data from the 2002 NHEA-Aligned Medical Expenditure Panel Survey (MEPS): Projected Medical Expenditures by Type of Service and Source of Payment for Age, Race and Sex through 2016**

### **1. Introduction**

This document describes projected household expenditure data from the 2002 Medical Expenditure Panel Survey (MEPS) Household Component file aligned with the 2002 National Health Expenditure Accounts (NHEA). MEPS is issued by the Center for Financing, Access and Cost Trends (CFACT), within the Agency for Healthcare Research and Quality (AHRQ) and the NHEA is issued by the Office of the Actuary within the Centers for Medicare and Medicaid Services (CMS). The 2002 NHEA-aligned MEPS is a product of the Division of Modeling and Simulation (DMS) within CFACT, produced with the cooperation of CMS<sup>1</sup>.

Projected expenditures are calculated in a two step process. First, core data from the 2002 NHEA-aligned MEPS file are projected to each end year through 2016 by adjusting MEPS person weights using Census projections<sup>2</sup> for population totals, fertility and mortality over time. Then, the re-weighted NHEA-aligned MEPS expenditures are calibrated annually by type of service and source of payment categories so that growth in the re-weighted NHEA-aligned MEPS expenditures matches growth in the projected NHEA<sup>3, 4</sup>. Users should be aware that these estimates are surrounded by uncertainty from a wide variety of sources detailed in Section 5 of this document<sup>5</sup>.

---

<sup>1</sup> For more details on NHEA-aligned MEPS, see: Sing et. al., 2006. "Reconciling Medical Expenditure Estimates from the MEPS and NHEA, 2002," *Health Care Financing Review* and Selden and Sing, 2008 "Aligning the Medical Expenditure Panel Survey to Aggregate U.S Benchmarks," AHRQ Working Paper #08006. (available online at [http://www.meps.ahrq.gov/mepsweb/data\\_stats/Pub\\_ProdResults\\_Details.jsp?pt=Working%20Paper&opt=2&id=862](http://www.meps.ahrq.gov/mepsweb/data_stats/Pub_ProdResults_Details.jsp?pt=Working%20Paper&opt=2&id=862)).

<sup>2</sup> Projected Population Totals, Projected Births and Projected Deaths by Age, Sex, Race, and Hispanic Origin based on the 2000 Census are issued by the Population Projections Branch at the Census Bureau. These projections are available online in the files NP2008\_D1, NP2008\_D2 and NP2002\_D3 respectively and can be downloaded from the Census Bureau website:

<http://www.census.gov/population/www/projections/downloadablefiles.html> (accessed March 2008).

<sup>3</sup> CMS's 2005 figures from file NHE65-16.CSV are used for NHEA expenditures. In NHE65-15.CSV, data for 1965-2005 represent historical expenditures, while data for 2006-2016 are projected expenditures. This data file is available to the public on the CMS web site by using the link entitled "The NHE Historical and Projections 1965-2016" on the following page:

[http://www.cms.hhs.gov/NationalHealthExpendData/03\\_NationalHealthAccountsProjected.asp](http://www.cms.hhs.gov/NationalHealthExpendData/03_NationalHealthAccountsProjected.asp)  
(accessed December 1, 2007).

<sup>4</sup> In order to calibrate NHEA-aligned MEPS to the NHEA, nursing home and assisted living expenditures by type of service and source of payment first had to be added to the NHEA-aligned MEPS expenditures because the survey does not collect these expenditures. There will be more detail on this adjustment in section 4 of this documentation.

<sup>5</sup> The sample design of the host datasets used for modeling efforts is often characterized by a complex multi-stage area probability design that includes disproportionate sampling of specified policy relevant population groups. As a consequence of departures from simple random sampling assumptions, the variances of the model based estimates derived from the host survey must take into account the complex survey design. Consequently, the error estimates that characterize these model-based estimates should reflect the component of variance attributable to the underlying sample and survey design. Furthermore,

The projection process yields a set of annual data files and summary statistics available for public use for all each year, 2003 through 2016. These files, named PMEPyy.DAT<sup>6</sup>, contain person level data with (i) individual level medical expenditures classified by type of service and source of payment categories, (ii) a person weight that enables national-level estimates, (iii) individual level demographic characteristics used in the aging procedure and iv) insurance and poverty status variables, not controlled for in the aging process<sup>7</sup>.

Each of the aged PMEPyy.DAT files contains a sample of 37,418 respondents. The files contain one record for each person and are designed to provide estimates that are representative of the civilian, non-institutionalized population of the US in the designated end year. While each record is distinguished by a person-level identification number, this variable does not enable researchers to link data from the projected NHEA-aligned MEPS files to any other MEPS data releases<sup>8</sup>, including the 2002 NHEA-aligned MEPS.

Tables are available to provide summary statistics on various characteristics from each year of the projected NHEA-aligned MEPS files as well as from the 2002 NHEA-aligned MEPS file.

## **2. Medical Expenditures: Type of Service and Source of Payment Categories**

Each person record contains data on the expenditures made within seven different types of service categories plus a total expenditure category. Total expenditures are calculated by adding expenditures for all seven categories<sup>9</sup>. The categories and their two to three character abbreviations are as follows:

1. Hospital: HOS
2. Physician: PHY

---

imputation is often used to correct for item nonresponse associated with measures that are essential for model specification. The overall variance of model based estimates should also incorporate an additional component of variance attributable to imputation. Additional sources of variation associated with population projections used in re-weighting to “age” the data need to also be accounted for. When all these components are accounted for in deriving estimates of the precision of the model-based estimates, this should be considered as a lower bound when attempting to characterize the overall mean square error to convey a measure of uncertainty in the results.

<sup>6</sup> Where yy is a two-digit year code. For example, the projected data file for 2015 has the name PMEP15.DAT.

<sup>7</sup> Researchers should use these variables with caution. The aging process for the NHEA-aligned MEPS does not control for changes in these measures, so any estimates with the projected data cross-classified by the poverty status or health insurance status variables are based on the assumption that 2002 poverty and health insurance status conditions remain unchanged in each future year. Any changes in poverty rates or health insurance status of individuals observed in the projected NHEA-aligned MEPS are an indirect result of the changing age, race and sex composition of the population that was directly controlled for in aging the data. These variables are included in the projected data sets purely for the convenience of end-users.

<sup>8</sup> Person identification numbers that would enable direct linkage of the projected NHEA-aligned MEPS data to previously released un-aged MEPS files were purposely omitted to prohibit users from making projections for population groups that were not statistically controlled for in the aging process.

<sup>9</sup> TOT = HOS + PHY +OTH + HHC + OBO + DVT + RX.

3. Other Medical: OTH
4. Home Health: HHC
5. Other Provider: OBO
6. Dental: DVT
7. RX: RX
8. TOTAL: TOT<sup>10</sup>

Previous users of MEPS Projected Expenditures will notice that the current data release no longer contains expenditure details at the sub-category level<sup>11</sup>. This level of detail is not available on the NHEA-aligned MEPS file, and therefore cannot be projected to future years.

The expenditures in each category are divided into nine sources of payment, plus a total. Total expenditures (EXP) equal the sum of the nine source of payment expenditure variables<sup>12</sup>. Those categories and their two to three character abbreviations are as follows:

1. Out of Pocket: SLF
2. Private Health Insurance: PHI
3. Medicare: MCR
4. Medicaid: MCD
5. Tricare: TRI
6. VA: VA
7. Workers Comp: WC
8. Other Public: OTP
9. Other: OSR
10. TOTAL: EXP<sup>10</sup>

Expenditure variables are named with the following convention: TosSopYY (i) the first two to three characters of the variable name contains the type of the service code, (ii) the next two to three characters contains the source of payment code and, (iii) the final two numbers are the last two digits of the end year. For example, if an individual had an out of pocket dental expense and a researcher wanted to access the projected expense in 2015, the variable of interest would be DVTSLF15. (i) DVT is the three character type of service code for dental expenses, (ii) SLF is the three character source of payment code for out of pocket payment and, (iii) 15 represents the end year 2015.

There are a total of 80 expenditure variables for all the type of service variables crossed with all the source of payment variables above. A full array of the 80 TOS by SOP variables can be found in Table 1 in the appendix.

---

<sup>10</sup> Note that Total Expenditures (TOT) by type of service equals Total Expenditures (EXP) by source of Payment.

<sup>11</sup> For example, earlier releases provided details on whether hospital expenditures resulted from emergency room use, inpatient procedures or outpatient procedures.

<sup>12</sup> EXP = SLF + PHI + MCR + MCD + TRI + VA + WC + OTP + OSR.

### **3. Population Aging**

Each person record includes a person-level sample weight needed to produce estimates for the civilian, non-institutionalized population of the US in the designated year. The weight on each file (WTADJyy) is derived from the 2002 NHEA-aligned MEPS weight. It is adjusted to reflect changes in the non-institutionalized civilian population between 2002 and the designated end year in a three step process. First, weights are adjusted to reflect population growth by age, race and sex based on historical and projected population estimates issued by the U.S. Census Bureau<sup>13</sup>. Second, the weights are adjusted for changes in mortality rates by race and sex. The third and final weight adjustment is for fertility rates by race. The fertility and mortality adjustments are based on historical statistics and projected estimates for U.S. births and deaths by year<sup>14, 15</sup>.

#### **3.1 Population Estimates and Projections**

Individuals in the 2002 NHEA-aligned MEPS sample are placed into cells based on age, race and sex categories to match definitions in the U.S. Census Bureau's population projections. The categories are broken down as follows: (i) Age: each year from 0 to 99 and 100+, (ii) Sex: Male, Female (iii) Race: a) Hispanic, b) White alone, Non-Hispanic, c) Black alone, Non-Hispanic, d) Asian alone, Non-Hispanic, e) American Indian and Alaskan Native Alone, Non-Hispanic, f) Native Hawaiian and Other Pacific Islander Alone, Non-Hispanic and, g) Two or More Races, Non-Hispanic. Population growth rates are calculated for each age, race and sex cell from 2002 to the designated end year using the Census projected population totals by age, race and sex. These growth rates are then applied to the person-level weights in the 2002 NHEA-aligned MEPS file by age, race and sex.

#### **3.2 Fertility Adjustments**

The second step in the re-weighting process involves fertility adjustments. These adjustments are made to population weights for two primary reasons: 1) fertility rates are

---

<sup>13</sup> Population projections were obtained from the U.S. Census Public Use file NP2008\_D1: Projected Population by Single Year of Age, Sex, Race and Hispanic Origin for the United States: July 1, 2000 to June 30, 2050. (available online at <http://www.census.gov/population/www/projections/downloadablefiles.html> - accessed March 2009). Historical Estimates for July 1, 2002 were obtained from the U.S. Census public use file NC-EST2007-alldata: Monthly Population Estimates by Age, Sex, Race and Hispanic Origin for the United States: April 1, 2000 to July 1, 2007 (available online at <http://www.census.gov/popest/national/asrh/2007-nat-detail.html> - accessed March, 2009).

<sup>14</sup> Projections of births/deaths were obtained from the U.S. Census Public Use files NP2008\_D2 and NP2008\_D3: Projected Births/Deaths by Sex, race and Hispanic Origin for the United States: July 1, 2000 to June 30, 2050. (available online at <http://www.census.gov/population/www/projections/downloadablefiles.html> - accessed March 2009).

Historical birth/death estimates were obtained from the U.S. Census via special request.

<sup>15</sup> Users should note that overall population growth takes into account fertility and mortality changes over time by age, race and sex. These fertility and mortality adjustments are made to account for individuals who give birth or die in MEPS. These individuals may have differential medical expenditures, so the mortality and fertility are included to adjust the weights of those individuals expenditures.

expected to change significantly over the projected period for certain sectors of the population and 2) fertility events are associated with relatively high medical expenditures. It should be noted that the fertility adjustments are somewhat different from the population adjustments.

For fertility adjustments women in the 2002 NHEA-Aligned MEPS were placed into the following race cells: a) White Alone, Non-Hispanic b) Black Alone, Non-Hispanic c) White Alone/Black Alone, Hispanic, d) Asian Alone, e) American Indian and Alaskan Native Alone, f) Native Hawaiian and Other Pacific Islander Alone and g) Two or More Races. Note that only categories a-c account for ethnicity. Census estimates are unavailable for categories d-g broken down by ethnicity.

The MEPS sample does not contain enough births to support fertility cells based on age and race and require the assumption that fertility changes over time are constant for women of all ages in each race category. This prohibits researchers from investigating fertility for particular age groups, such as teens or older women, who may be expected to have greater fluctuation in fertility over time relative to other women within their same race category.

Fertility growth rates are calculated for each race cell from 2002 to the designated end year using historical statistics and projected estimates by race from Census<sup>16</sup>. These race specific growth rates are then applied to the person-level weight for each woman who gave birth in the 2002 NHEA-Aligned MEPS sample<sup>17</sup>. In order to maintain a constant total population by race, a final adjustment is made to the person-level weights for those women who did not give birth in the 2002 NHEA-Aligned MEPS sample. The size of this adjustment depends on how many women in the race cell gave birth and the size of the growth adjustment applied to the women who gave birth.

### **3.3 Mortality Adjustments**

The third and final step in the re-weighting process involves mortality adjustments. These adjustments are identical in practice to the fertility adjustments, except that they are applied to both men and women. The adjustments are made for two primary reasons: 1) mortality rates are expected to change significantly over the projected period for certain sectors of the population and 2) mortality events are associated with relatively high medical expenditures

Individuals in the 2002 NHEA-Aligned MEPS were placed into the following sex, race cells: (i) male, female (ii) a) White Alone, Non-Hispanic b) Black Alone, Non-Hispanic c) White Alone/Black Alone, Hispanic, d) Asian Alone, e) American Indian and Alaskan Native Alone, f) Native Hawaiian and Other Pacific Islander Alone and g) Two or More

---

<sup>16</sup> See footnote 13.

<sup>17</sup> Note: Census reports birth rates for individuals at age 0 by race and sex. Each birth is associated with a mother who has given birth. Because most medical expenditures are associated with the mother, we combine births of all sex and apply those rates to new mothers in MEPS of that race. We must assume that the race reported for the child in Census is the same as that of the mother.

Races. As with fertility, only categories a-c account for ethnicity. Census estimates are unavailable for categories d-g broken down by ethnicity.

The sample does not contain enough deaths to support mortality cells based on age, race and sex, and requires the assumption that mortality changes over time are constant for individuals of all ages in each race and sex category. This constraint prohibits researchers from investigating mortality for particular age groups, such as infants or the elderly, who may be expected to have greater changes in mortality over time relative to other individuals within their same race category.

Mortality growth rates are calculated for each race cell from 2002 to the designated end year using historical statistics and projected estimates by race and sex from Census<sup>18</sup>. These race and sex specific growth rates are then applied to the person-level weight for each individual who died in the 2002 NHEA-Aligned MEPS sample. In order to maintain a constant total population by race and sex, a final adjustment is made to the person-level weights for those individuals who did not die in the 2002 NHEA-Aligned MEPS sample. The size of this adjustment depends on how many individuals die in a given race, sex cell and the size of the growth adjustment applied to those who die.

#### **4. Calibration to National Health Accounts**

The last step of the aging process is a calibration of each re-weighted NHEA-aligned MEPS file to the National Health Expenditure Accounts for the same year by type of service and source of payment. This process ensures that growth rates in NHEA-aligned MEPS expenditures by type of service and source of payment between 2002 and a designated end year will be in accordance with growth rates predicted by the NHEA.

In order to calibrate NHEA-aligned MEPS to the NHEA, it is first necessary to obtain expenditures for nursing home and assisted living for 2002, because MEPS does not include these expenditures in the survey. These totals were obtained from Actuarial Research Corporation (ARC)<sup>19</sup> by type of service and source of payment for 2002. For years beyond 2002, the ARC totals are aged by the growth rates projected by CMS in the National Health Expenditure Accounts for nursing home expenditures by type of service and source of payment.

The calibration procedure is as follows for each designated end year: (i) Expenditures from the re-weighted NHEA-aligned MEPS file are totaled by the seven type of service categories and the nine source of payment categories for a total of 63 TOS-SOP cells for a given end year. (ii) Nursing home and assisted living expenditures are added to the 2002 NHEA-aligned MEPS expenditures by type of service and source of payment. (iii)

---

<sup>18</sup> See footnote 13.

<sup>19</sup> Nursing home and assisted living expenditures by type of service and source of payment: Unpublished data made available to AHRQ and CMS by ARC for the completion of Sing et. al. 2006. Adjustments to the original ARC estimates were made by a team of researchers at AHRQ, CMS and ARC to best match the needs of reconciling the 2002 MEPS and 2002 NHEA expenditures.

"Aged" nursing home and assisted living expenditures for the designated end year are added to the re-weighted NHEA-aligned MEPS file by type of service and source of payment. (iv) Growth rates from 2002 to the designated end year are calculated for each of the TOS-SOP categories for the NHEA-aligned MEPS re-weighted data. (v) Growth rates are calculated for the corresponding TOS-SOP categories for the NHEA using historical and projected data based on 2005 estimates from CMS. (vi) Using the NHEA and NHEA-aligned MEPS growth rates, a calibration factor<sup>20</sup> is created for each TOS-SOP category for the designated end year. (vii) Expenditures in the re-weighted NHEA-aligned MEPS file are multiplied by TOS-SOP specific calibration factors.

## 5. Additional Data Details and Caveats

It is important to emphasize that there are several sources of error associated with the NHEA-Aligned MEPS projected expenditures and with any estimates produced using these data. So, while the NHEA-Aligned MEPS projected expenditure file does not include variance measures and the summary tables do not include standard errors, these data are surrounded by several sources of uncertainty. Sources of error include sampling error in the MEPS and NHIS files, variation resulting from the data collection and projection techniques used by Census Bureau and CMS in creation of the Census and NHEA files, uncertainty in ARC estimates of the nursing home and assisted living population, variation resulting from the alignment of the 2002 MEPS and 2002 NHEA files and, finally, variation from the procedures used to age the MEPS population and calibrate aged expenditures to NHEA growth.

Researchers should note that the current release of projected MEPS expenditures differs from those in previous years. Projected expenditures from the 1996 MEPS were calculated directly from the 1996 MEPS-HC Full Year Consolidated Public Use File (HC-012). While research and statistics were available to explain and reconcile differences found in the 1996 MEPS and 1996 NHEA totals<sup>21</sup>, none of these adjustments were applied to the MEPS file used in the expenditure projections. By using the 2002 NHEA-aligned MEPS instead of the 2002 MEPS Full Year Consolidated File (HC-070), the current release has been improved and takes into account differences found between the 2002 MEPS and NHEA totals. However, it is important to recognize that the projected totals are no longer directly comparable to the MEPS-HC Full Year Consolidated Public Use Files.

---

<sup>20</sup> The calibration factor is calculated as follows: (growth rate for NHEA expenditures/growth rate for population aged NHEA-aligned MEPS expenditures). Note there is a different calibration factor for each designated end year and for each TOS-SOP category. See Table 2 in the appendix for the corresponding NHEA and NHEA-aligned MEPS expenditures used for the calibration.

<sup>21</sup> Selden, Thomas M., et. al., "Reconciling Medical Expenditure Estimates from the Medical Expenditure Panel Survey and the National Health Accounts," *Healthcare Financing Review*.

## 6. File Variables

The output files contain person level data with (i) personal medical expenditures classified by eight (including a total) type of service and ten (including a total) source of payment categories, (ii) a person weight that enables national-level estimates, (iii) individual level demographic characteristics used in the re-weighting procedure and iv) insurance and poverty status variables, not controlled for in the aging process. Variable definitions and codebooks are listed below:

### 6.1 Variable List:

<b>DUPERIDX</b>	Person identification number on Projected files
<b>PERWTP</b>	NHEA-aligned MEPS person weight on the Base 2002 NHEA-Aligned MEPS file (This variable appears only on the 2002 Base file)
<b>WTADJyy</b>	NHEA-aligned MEPS person weight adjusted to end year YY for population growth (This variable does not appear on the 2002 Base file)
<b>AGESTUB</b>	Age in years, top-coded at 85
<b>RACE7</b>	Seven category race variable
<b>SEX</b>	Sex
<b>INSCOV_A</b>	Insurance status for individuals under age 65 - annual measure
<b>INSCOV_B</b>	Insurance/Medicaid status for individuals age 65 and over - annual measure
<b>POVCAT</b>	Poverty status based on annual family income
<b>PRVHMO</b>	HMO status for those with private health insurance – had private HMO or managed care plan during the year
<b>MCDHMO</b>	HMO status for those with Medicaid, SCHIP or other public (excluding Champus) health insurance – had Medicaid, SCHIP or other public HMO or managed care plan during the year
<b>TOSSOPyy</b>	Expenditures by type of service and source of payment 80 categories

### 6.2 Control Variables:

AGESTUB, RACE7 and SEX were used as part of the population aging process to create new person weights based on growth in the interim Census population projections by age, sex, race and Hispanic origin.

### 6.3 Variable Definitions and Codebook

#### Key expenditure and control variables

**DUPERIDX** Unique person identification number for each individual on the NHEA-aligned MEPS file and on each Projected NHEA-aligned MEPS file. This variable cannot be used to link individuals across years and cannot be used

to link to other MEPS data sets. Person identification numbers that would enable direct linkage of the projected MEPS data to previously released un-aged MEPS files were purposely omitted to prohibit users from making projections for population groups that were not statistically controlled for in the aging process. Furthermore, these expenditures represent a single cross-section of individuals aged to different points into the future. The omission of linkable ID's discourages users from incorrectly interpreting these expenditures as a panel of expenditures for a given individual over time .

<b>PERWTP</b>	2002 person weight from the NHEA-aligned MEPS file. This variable appears only on the 2002 Base file, it does not appear on any of the projected year files.
<b>WTADJyy</b>	2002 person weight from NHEA-aligned MEPS file, adjusted to end year YY for population, mortality and fertility growth. These weights allow researchers to get national level population estimates. Researchers should be careful when sub-setting by control variables. Un-weighted cell sizes must be greater than 100 individuals to obtain nationally representative estimates. Cell sizes can get very small when using variables such as age (especially when using single year categories). This variable does not appear on the 2002 Base file, only on the projected year files.
<b>AGESTUB</b>	Age of individual as of Dec. 31, 19yy. Note: A similar age variable used for population re-weighting was top-coded at 100. The variable released on this file is more restrictive for confidentiality purposes.  <u>Definition:</u> Age in years from 0 to 85, top-coded at 85.
<b>RACE7</b>	Race of individual, used for population re-weighting.  <u>Definition:</u> 1 = Hispanic 2 = White alone, Non-Hispanic 3 = Black alone, Non-Hispanic 4 = American Indian or Alaskan Native alone, Non-Hispanic 5 = Asian alone, Non-Hispanic 6 = Native Hawaiian or Other Pacific Islander alone, Non-Hispanic 7 = Two or more races, Non-Hispanic

**SEX** Sex of individual, used for population re-weighting adjustment

Definition:

- 1 = Male
- 2 = Female

**TOSSOPyy** Medical expenditure variables by type of service and source of payment. The variable contains actual expenditure amount in dollars. Each year there are 80 variables covered by the type of service and source of payment categories. See section 2 for detailed information on the naming convention of these variables. Section 2 will also provide detailed information on the mathematical relationship between these variables and how the variables can be summed to create expenditure totals for major type of service categories.

**Additional variables, not statistically controlled for in aging**

The following variables are created for the convenience of end users of the projected MEPS expenditure data. These variables were NOT statistically controlled for when aging the data. Researchers should be cautioned that any estimates using the projected data cross-classified by poverty status or insurance status are based on the assumption that 2002 poverty and health insurance conditions remain unchanged in each future year.

**INSCOV\_A** Insurance status for individuals under age 65. (AGESTUB < 65) This variable is an annual measure, measuring whether the individual had insurance at any point during the year. Because individuals can have coverage from multiple health insurance sources, this variable is built hierarchically. All individuals ages 65 and over, regardless of insurance status, are placed in category 5; INSCOV\_B will measure insurance status for these individuals. Note: Employment related private insurance in category 1 does not include self employed persons with firm size of 1 who purchase health insurance for themselves. These individuals would be assigned, instead, to category 2.

Definition:

- 1 = Any Private, employment related or TRICARE insurance during the year
- 2 = Any Private, not employment related insurance during the year
- 3 = Any Public (Medicaid, SCHIP or Medicare) insurance during the year
- 4 = Uninsured for entire year
- 5 = Age 65 or older

**INSCOV\_B** Insurance/Medicaid/Medicare status for individuals age 65 and over. (AGESTUB  $\geq$  65) This variable is an annual measure, measuring whether the individual had insurance at any point during the year. Because individuals can have coverage from multiple health insurance sources, this variable is built hierarchically. Several categories of this variable are intended to measure whether individuals held multiple coverage sources at the same time. For example, category 3 includes an individual who was covered by both Medicare and a privately purchased policy in the month of February but does not include someone who was covered only by a privately purchased policy in January and covered only by Medicare in March. This second individual would fit in category 4. Note: Employer insurance in category 2 does not include persons who were self employed with firm size of 1 who had purchased health insurance for themselves. These individuals would be assigned, instead, to category 3.

Definition:

- 1 = inapplicable (under age 65)
- 1 = Held both Medicaid and Medicare at the same time during the year
- 2 = Held both Medicare and Employment related Private insurance at the same time during the year
- 3 = Held both Medicare and Non-Employment related Private insurance at the same time during the year
- 4 = Held Medicare alone during the year
- 5 = Held no Medicare during the year

**POVCAT** Poverty status based on annual family income.

Definition:

- 1 = less than 1.00 times poverty line
- 2 = 1.01 to 1.24 times poverty line
- 3 = 1.25 to 1.99 times poverty line
- 4 = 2.0 to 3.99 times poverty line
- 5 = 4.00 or more times poverty line

**PRVHMO** Individual was enrolled in a private HMO or managed care plan during the year.

Definition:

- 1 = yes
- 2 = no

***MCDHMO*** Individual was enrolled in a Medicaid, SCHIP or other public HMO or managed care plan during the year.

Definition:

1 = yes

2 = no

**Table 1**

**Array of Expenditure Service Categories by Type of Service and Source of Payment Available on Projected Database Files**

<b>Service Category</b>		<b>Out of Pocket</b>	<b>Private Insurance</b>	<b>Medicare</b>	<b>Medicaid</b>	<b>Tricare</b>	<b>VA</b>	<b>Workers Comp</b>	<b>Other Public</b>	<b>Other</b>	<b>Total</b>
